Risk Register: Cookie Cats Gate Test

Prepared by: Palak Gupta | Date: 15 October 2026 | Status: Final (portfolio case study)

Eight risks are tracked. Three are still open and limit how far the result can be pushed; the follow-up test proposed in the decision memo addresses them. Owners are illustrative roles.

Risk register

ID	Risk	Probability	Impact	Mitigation	Owner	Status
R1	Only 7 days of retention were measured, so long-term effects are unknown	High	Medium	State the limit in the memo and run a follow-up test measuring 14 to 28 days	Product lead	Open
R2	No revenue data, so the business impact rests on an assumed Rs 50 per retained player	High	Medium	Label it as an assumption, show a low and high case, and have the product lead confirm the real value	Product lead	Open
R3	Player-group results use rounds played after assignment, so the gate itself may have shaped them	Medium	Medium	Present them as exploratory and confirm with a targeted follow-up test	Data analyst	Open
R4	Running several tests raises the chance of a false positive	Medium	High	Applied Bonferroni correction; the 7-day result still holds (adjusted p = 0.0048)	Data analyst	Mitigated
R5	Group balance check was flagged (p = 0.0086)	Low	Medium	Checked the size gap (about 0.9 points), documented it, and confirmed three methods agree	Data analyst	Mitigated
R6	A borderline result on rounds played (p = 0.051) could be misread as proof of no effect	Medium	Low	Worded as "no evidence of a difference" in the memo and README	Data analyst	Mitigated

ID	Risk	Probability	Impact	Mitigation	Owner	Status
R7	Google Colab sessions reset and lose loaded data	High	Low	Keep setup cells at the top, save the notebook and charts, and publish the code on GitHub	Data analyst	Mitigated
R8	One player with 49,854 rounds could distort averages	High	Medium	Removed that single record and used medians and a rank-based test for rounds played	Data analyst	Closed

How to read this

- Probability and impact are rated High, Medium or Low on the analyst's judgment, not a calculation.
- Open means the risk still exists today; Mitigated means action was taken and some risk remains; Closed means it no longer applies.
- Review the open risks again after the follow-up test, and update this register if the findings change.
